In order to learn how circular economy works, we attended some online lessons on the LOOP platform. Our general experience was good and useful, because we enjoyed listen to the teachers who told us about four fundamental topics of the circular economy: redesign, reduce, recycling and reuse. The final test helped us to store information about our project LOOP and its purpose: advice the students about the environmental situation and raise their awareness in order to convince them to take care of our planet.

Among these four topics, we found that the most interesting one was the Reduce. For us, it's important because environmental problems usually depend on CO_2 emissions and other dangerous things like petroleum and plastic which are in the air and in the water and they are harmful for plants, ecosystems and people.

We personally think that the subjects of the LOOP organization is complete enough, but there are a few things that we suggest to change: we'd like if this topic was more discussed in the classroom and in the houses of everyone who participate to the project and if more students were involved with the LOOP ERASMUS, because we found it very interesting and important for our lives; another thing is that not only the students have to listen to the teachers words, but everyone should be interested on that argument.
